## **ABSTRACT**

This project focuses on predicting the Human Development Index (HDI), which is a comprehensive measure of well-being. The HDI considers key factors such as life expectancy, education, and income.

In this project, machine learning techniques are used to build a predictive model using historical data. The model is trained using Linear Regression and is capable of estimating HDI values based on user inputs.

A web application is also developed using Flask, allowing users to input data and receive real-time predictions along with HDI classification categories such as Low, Medium, High, and Very High.

This project demonstrates the integration of data science and web development to solve real-world problems.

## **PROBLEM STATEMENT**

Human Development Index (HDI) is an important indicator used to measure the overall development and well-being of a country. However, calculating HDI manually for different conditions can be time-consuming and complex.

The objective of this project is to build a system that can predict HDI based on key indicators such as life expectancy, education levels, and income using machine learning techniques.

## **FEATURES**

- Predicts Human Development Index (HDI)
- Classifies HDI into categories (Low, Medium, High, Very High)
- User-friendly web interface
- Real-time prediction using Flask
- Data visualization using graphs

# TECH STACK

## Programming Language:

- Python

## Libraries Used:

- Pandas
- NumPy
- Matplotlib
- Seaborn
- Scikit-learn
- Pickle

## Web Framework:

- Flask

## Tools:

- Google Colab
- VS Code

## INSTALLATION STEPS

1. Install Python (3.x)
2. Install required libraries:  
`pip install flask pandas numpy scikit-learn matplotlib seaborn`
3. Download the project files:
  - app.py
  - hdi\_model.pkl
  - templates folder
4. Navigate to project folder:  
`cd hdi_web_app`
5. Run the application:  
`python app.py`

## USAGE INSTRUCTIONS

1. Open browser and go to:  
<http://127.0.0.1:5000/>
2. Enter the following details:
  - o Life Expectancy
  - o Expected Years of Schooling
  - o Mean Years of Schooling
  - o GNI per Capita
3. Click on "Predict"
4. The system will display:
  - o Predicted HDI value
  - o HDI Category

# ER Diagram

Figure: Entity Relationship (ER) Diagram of HDI Prediction System

The above Entity Relationship (ER) Diagram represents the structure of the HDI Prediction System. It illustrates the relationship between different entities involved in the system.

The USER entity provides input data such as life expectancy, education details, and income through the web application. This input is stored in the INPUT\_DATA entity.

The MODEL entity represents the machine learning model used for prediction, which is trained using the DATASET entity containing historical data.

The PREDICTION entity stores the output generated by the model, including the predicted HDI value and its corresponding category.

The relationships show that a user can submit multiple inputs, the model uses input data to generate predictions, and the dataset is used to train the model.

This diagram helps in understanding how data flows through the system and how different components interact with each other.

The ER diagram ensures proper data organization and helps in designing a scalable and efficient system.

## SCREENSHOTS

Figure 1: HDI Distribution Histogram

Figure 2: Correlation Heatmap

Figure 3: HDI vs Life Expectancy

Figure 4: Web Application Interface

## Human Development Index Predictor

## Human Development Index Predictor

**Predicted HDI: 0.2041 (Low)**

## **FUTURE SCOPE**

- o Improve model accuracy using advanced algorithms
- o Add more features and real-time data
- o Deploy the application online
- o Enhance UI design
- o Add user authentication system
